- 1. Stone Size Use 2 inch stone, or reclaimed or recycled concrete equivalent.
- 2. Length As required.
- 3. Thickness Not less than six (6) inches.
- 4. Width Twenty (20) foot minimum, but not less than the full width at points where ingress or egress occurs.
- 5. Filter Cloth will be placed over the entire area prior to placing of stone.
- 6. Surface Water All surface water flowing or diverted toward construction entrances shall be piped across the entrance. If piping is impractical, a mountable berm with 5:1 slopes will be permitted.
- 7. Maintenance The entrance shall be maintained in a condition which will prevent tracking or flowing of sediment onto public right-of-way. This may require periodic top dressing with additional stone as conditions demand and repair and/or cleanout of any measures used to trap sediment. All sediment spilled, dropped, washed or tracked onto public rights—of—way must be removed immediately.
- 8. Washing Wheels shall be cleaned to remove sediment prior to entrance onto public right-of-ways. When washing is required, it shall be done on an area stabilized with stone and which drains into an approved sediment trapping device.
- 9. Periodic inspection and needed maintenance shall be provided after each rain.

Construction Sequence

- Install required sediment fence and inlet protection on existing inlets as shown on Phase 1 Plan
- Install utilities and storm sewers. Provide inlet protection.
- Construct proposed street and utilities. Stabilize the disturbed areas per temporary and permanent seeding requirements.
- Remove storm sewer inlet protection.

Note A: The Contractor shall be responsible for maintaining on-site drainage at all times during construction. No separate payment shall be made for maintaining drainage.

This SWP3 plan must be posted on—site. A copy of the SWP3 plan and the approved OEPA storm water permit (with site specific NOI number) must be kept on—site at all times.

Direct discharge of sediment laden water to the city's sewer system or a receiving stream is a violation of Ohio EPA and City of Columbus regulations; the contractor will be held liable for the violation and subsequent fines.

PAVEMENT CUTTING, SAWING AND EXCAVATION OPERATIONS NOTE:

Persuant to Phase II regulations of the NPDES amendment to the Clean Water Act of the United States of America, all public agencies and private contractors performing pavement—cutting operations on City of Columbus streets and roadways shall protect our environment from the dimunitive discharges created by their pavement cutting operations.

This requirement includes but is not limited to wet or dry saw-cutting, jack hammering, excavation equipment use, etc. The public agency and/or private contractor work crews shall recover and dispose of particles, polluted waters, or other such small discharges resulting from their pavement cutting operations and protect all storm sewer inlets from receiving runoff of said diminutive discharges. The agency or contractor responsible for each pavement cutting activity shall be solely liable for Notice of Violations (NOV/s) and fines issued by city of Columbus and/or State of Ohio authorities.

Equipment, materials and methods shall be provided by the responsible public agency and/or private contractor to work crews performing the pavement cutting activity and made available to work crews for use in cleaning up the small discharges resulting from such cutting activities and preventing runoff. Additionally, work crews shall be trained to exercise and employ equipment, materials, and environmental protective measures, to prevent discharges from entering the City of Columbus storm sewer systems and watercourses. All pay and work items with pavement cutting, sawing, or excavation shall abide by this note.

Moreover, if project plans, notes and /or drawings include a Stormwater Pollution Prevention Plan (SWP3) or a spill prevention/remediation plan; such plans shall be adhered to in addition to this note for all pavement cutting, sawing, or excavation operations on City of Columbus streets and roadways.

The details shown on the plan shall be considered a minimum. Additional or alternate details may be found in the O.D.N.R. Manual "Rainwater and Land Development". The Contractor shall be solely responsible for providing necessary and adequate measures for proper control of erosion and sediment runoff from the site along with proper maintenance and inspection in compliance with the NPDES General Permit for Storm Water Discharges Associated with Construction Activity.

CONTRACTOR RESPONSIBILITY: Details have been provided on the plans in an

effort to help the Contractor provide erosion and sedimentation control.

Prior to Construction Operations in a particular area, all sedimentation and erosion control features shall be in place. Field adjustments with respect to locations and dimensions may be made by the Engineer.

The Contractor shall place inlet and channel protection for erosion control immediately after construction of the inlets or channels which are not tributary to a sediment basin or dam

It may become necessary to remove portions of the barrier during construction to facilitate the grading operations in certain areas. However, the barrier shall be in place in the evening or during any inclement weather.

The limits of seeding and mulching are as shown within the plans. Those areas disturbed outside the seeding limits shall be seeded and mulched at the Contractor's expense.

"Temporary seeding" No area for which grading has been completed or where a denuded area will remain idle for more than 21 days shall be left unseeded for longer than 7 days. If permanent seed is not applied at this time, temporary seeding shall be done at the following rates:

March 1 to August 15

2 lbs./1,000 Sq.Ft. Fertilizer: (12:12:12) 25 lbs./1,000 Sq.Ft. Mulch: (Straw or Hay) 2 tons/acre

November 1 to March 1 Mulch (ONLY): (Straw or Hay) 2 tons/acre

"Permanent seeding" shall be done between March 15 and September 15. If seeding is done between September 15 and March 15, it shall be classified as "Temporary Seeding." Permanent seed shall be 40% Kentucky Bluegrass, 40% Creeping Red Fescue, 20% Annual Ryegrass. Permanent seeding shall consist of fertilizing, watering and seeding rates indicated under Item 659. Seeding shall be applied within two (2) days after final grading or following seed bed preparation.

Rates of application of Item 659: 4 lbs./1,000 Sq.Ft. Fertilizer: (12:12:12) 20 lbs./1,000 Sq.Ft. 2 tons/acre (3 tons/acre) Mulch: Straw (Hay)

MAINTENANCE: It is the Contractor's responsibility to maintain the sediment control features used on this project. The site shall be inspected periodically and within 24 hours of a significant rainfall. Records of these inspections shall be kept and made available to jurisdictional agencies if requested. Any sediment or debris which has reduced the efficiency of a structure shall be removed immediately. Should a structure or feature become damaged, the Contractor shall repair or replace at no additional cost to the Owner. Not all details shown on this sheet may be required for this project. Reference Sediment Control Plan.

The cost for temporary channels, sediment dams, sediment basins, and other appurtenant earthmoving operations shall be included in the price bid for erosion and sedimentation control quantities.

Not all details shown on this sheet may be required for this project.

The Contractor shall be responsible to ensure that off—site tracking of sediments by vehicles and equipment is minimized. All such off—site sediment shall be cleaned up daily. Construction of stabilized construction entrances are a part of that responsibility.

Street Cleaning (on an as-needed basis) ir required through the duration of this construction project. This includes sweeping, power cleaning and (if necessary) manual removal of dirt or mud in the street gutters.

The Contractor shall be responsible to ensure that no solid or liquid waste is discharged into stormwater runoff. Sediment—laden water shall be filtered through the use of sediment filtering fences or sedimentation basins prior to discharge to surface waters. Concrete trucks will not be allowed to wash out or discharge surplus concrete into or alongside rivers, streams, and creeks or into natural or man—made channels or swales leading thereto. Concrete truck wash water and surplus concrete shall be confined to areas approved by the Engineer; after solidifying, these waste materials shall be removed from the site.

ALL EROSION & SEDIMENT CONTROL PRACTICES ARE SUBJECT TO FIELD MODIFICATION AT THE DIRECTION OF THE CITY OF COLUMBUS AND/OR OHIO

EXISTING SITE The entire project Corridor discharges directly to the CONDITIONS: Linden Ditch (Argyle Ditch). Storm water reaches Linden

Ditch via existing storm sewer systems. SITE DISTURBANCE: Project earth disturbance area is: XX acres

RECEIVING STREAM: Alum Creek

EROSION AND

SEDIMENT

MEASURES:

ADJACENT AREAS: The project corridor is located within a residential area and commercial area.

CRITICAL AREAS: Work will occur in existing stream channels in the area of the proposed detention basin and box culvert at

Parkwood Avenue.

Erosion and sediment will be controlled by the use of inlet protection at storm sewer inlets and the use of construction techniques to minimize the disturbance along the existing channel. To the extent practical, "clean water" from the upstream watershed will be diverted around the in-stream construction activities and sediment—laden water from the construction area will be filtered prior to being released to the downstream

channel.

PERMANENT All disturbed areas shall be seeded and mulched. STABILIZATION: Geotextile reinforcement of earthen embankment is specified when in vicinity of channel banks. Hardened,

non-erodible materials area also specified for channel bank reinforcement.

MAINTENANCE: All erosion control devices are to be inspected by the construction superintendent daily and after rainfalls.

Any damaged facilities are to be replaced / repaired immediately as may be necessary.

The Contractor shall provide a schedule of operations to the City. Sedimentation and erosion control features

shall be placed and maintained in accordance with this schedule.

Note: The use of straw wattles has proven to be a versatile and effective ESC BMP, especially in residential settings. Straw wattles may be substituted for silt fence in linear installations. See detail, Sheet XX. The use of compost filter socks and compost blankets are gaining wider acceptance nationwide. they are now approved for use on all Columbus SWP3 plans

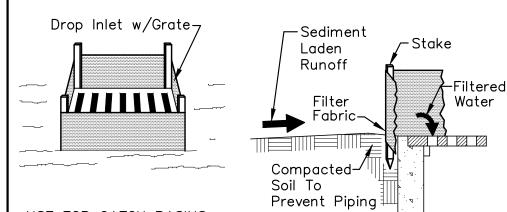

MAINTENANCE:

Should the fabric on a silt fence or filter barrier decompose or become ineffective prior to the end of the expected usable life and the barrier is still necessary, the fabric shall be replaced promptly.

Sediment deposits should be removed after each storm event. They must be removed when deposits reach approximately one—half the

Any sediment deposits remaining in place after the silt fence or filter barrier is no longer required shall be dressed to conform with the existing grade, prepared and seeded.

FILTER FABRIC CATCH BASIN PROTECTION

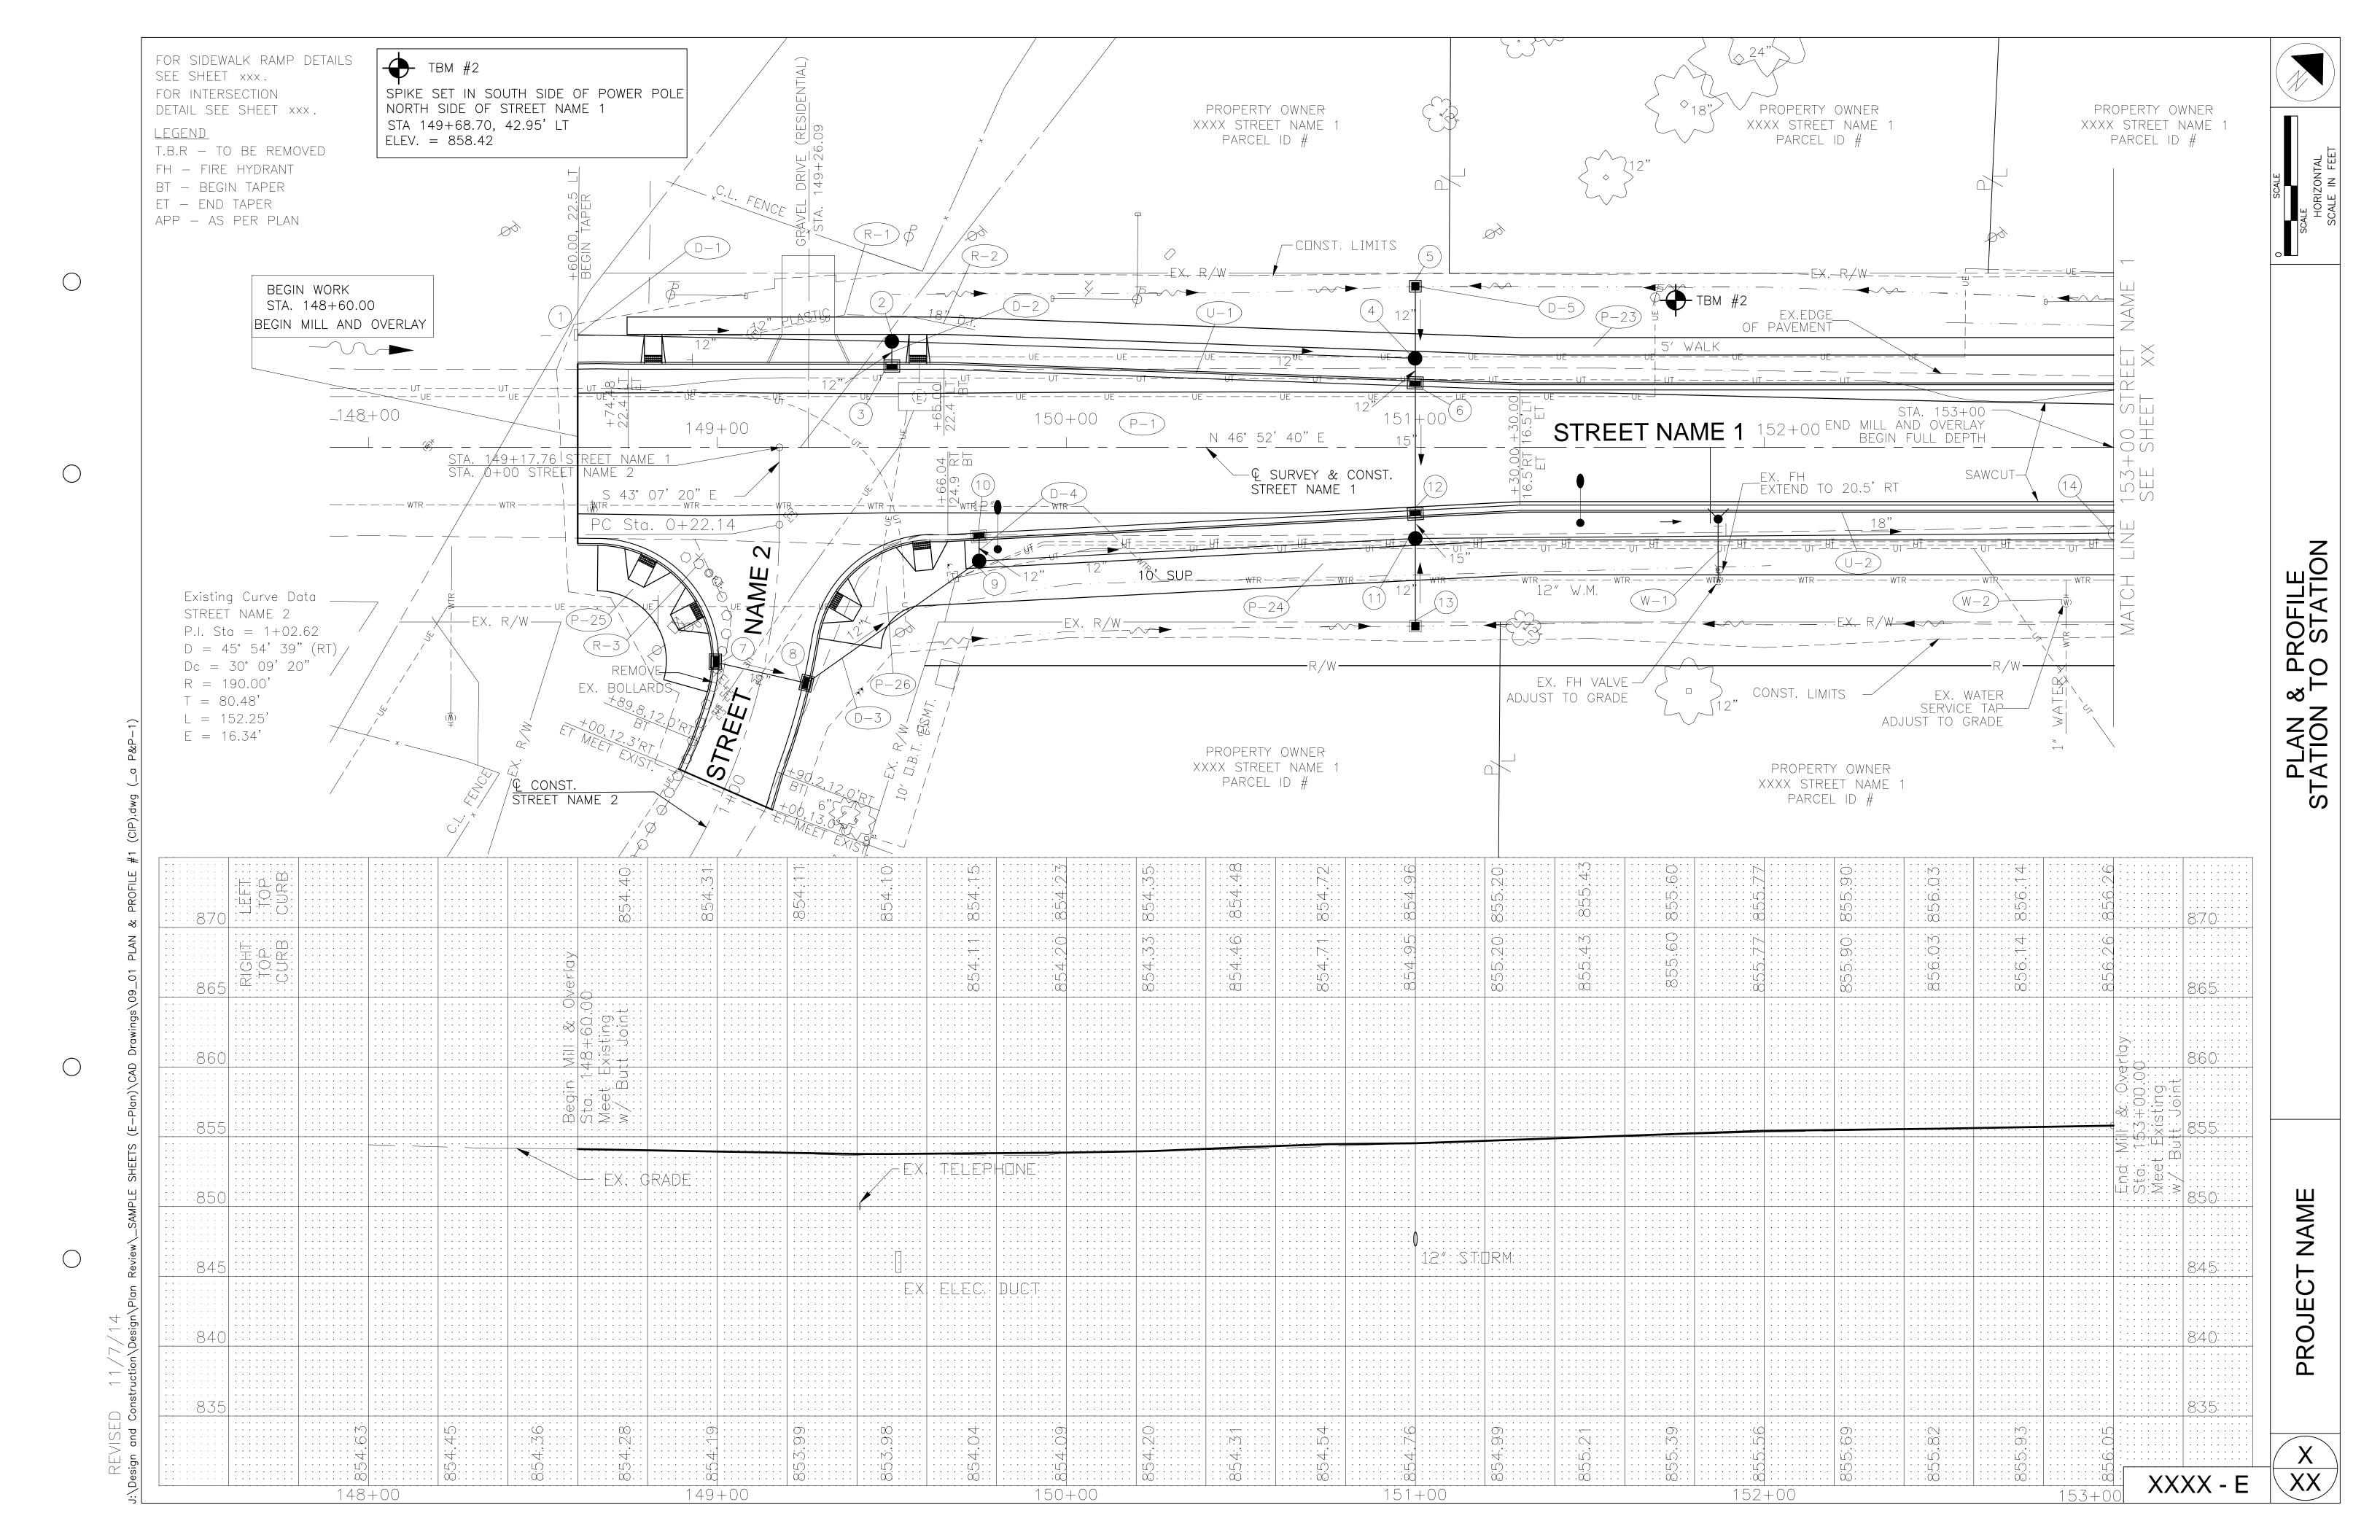

USE FOR CATCH BASINS: 57, 104, 105, 110-117, 119, 121-123, 145-148, Existing (See sheets 24 & 28)

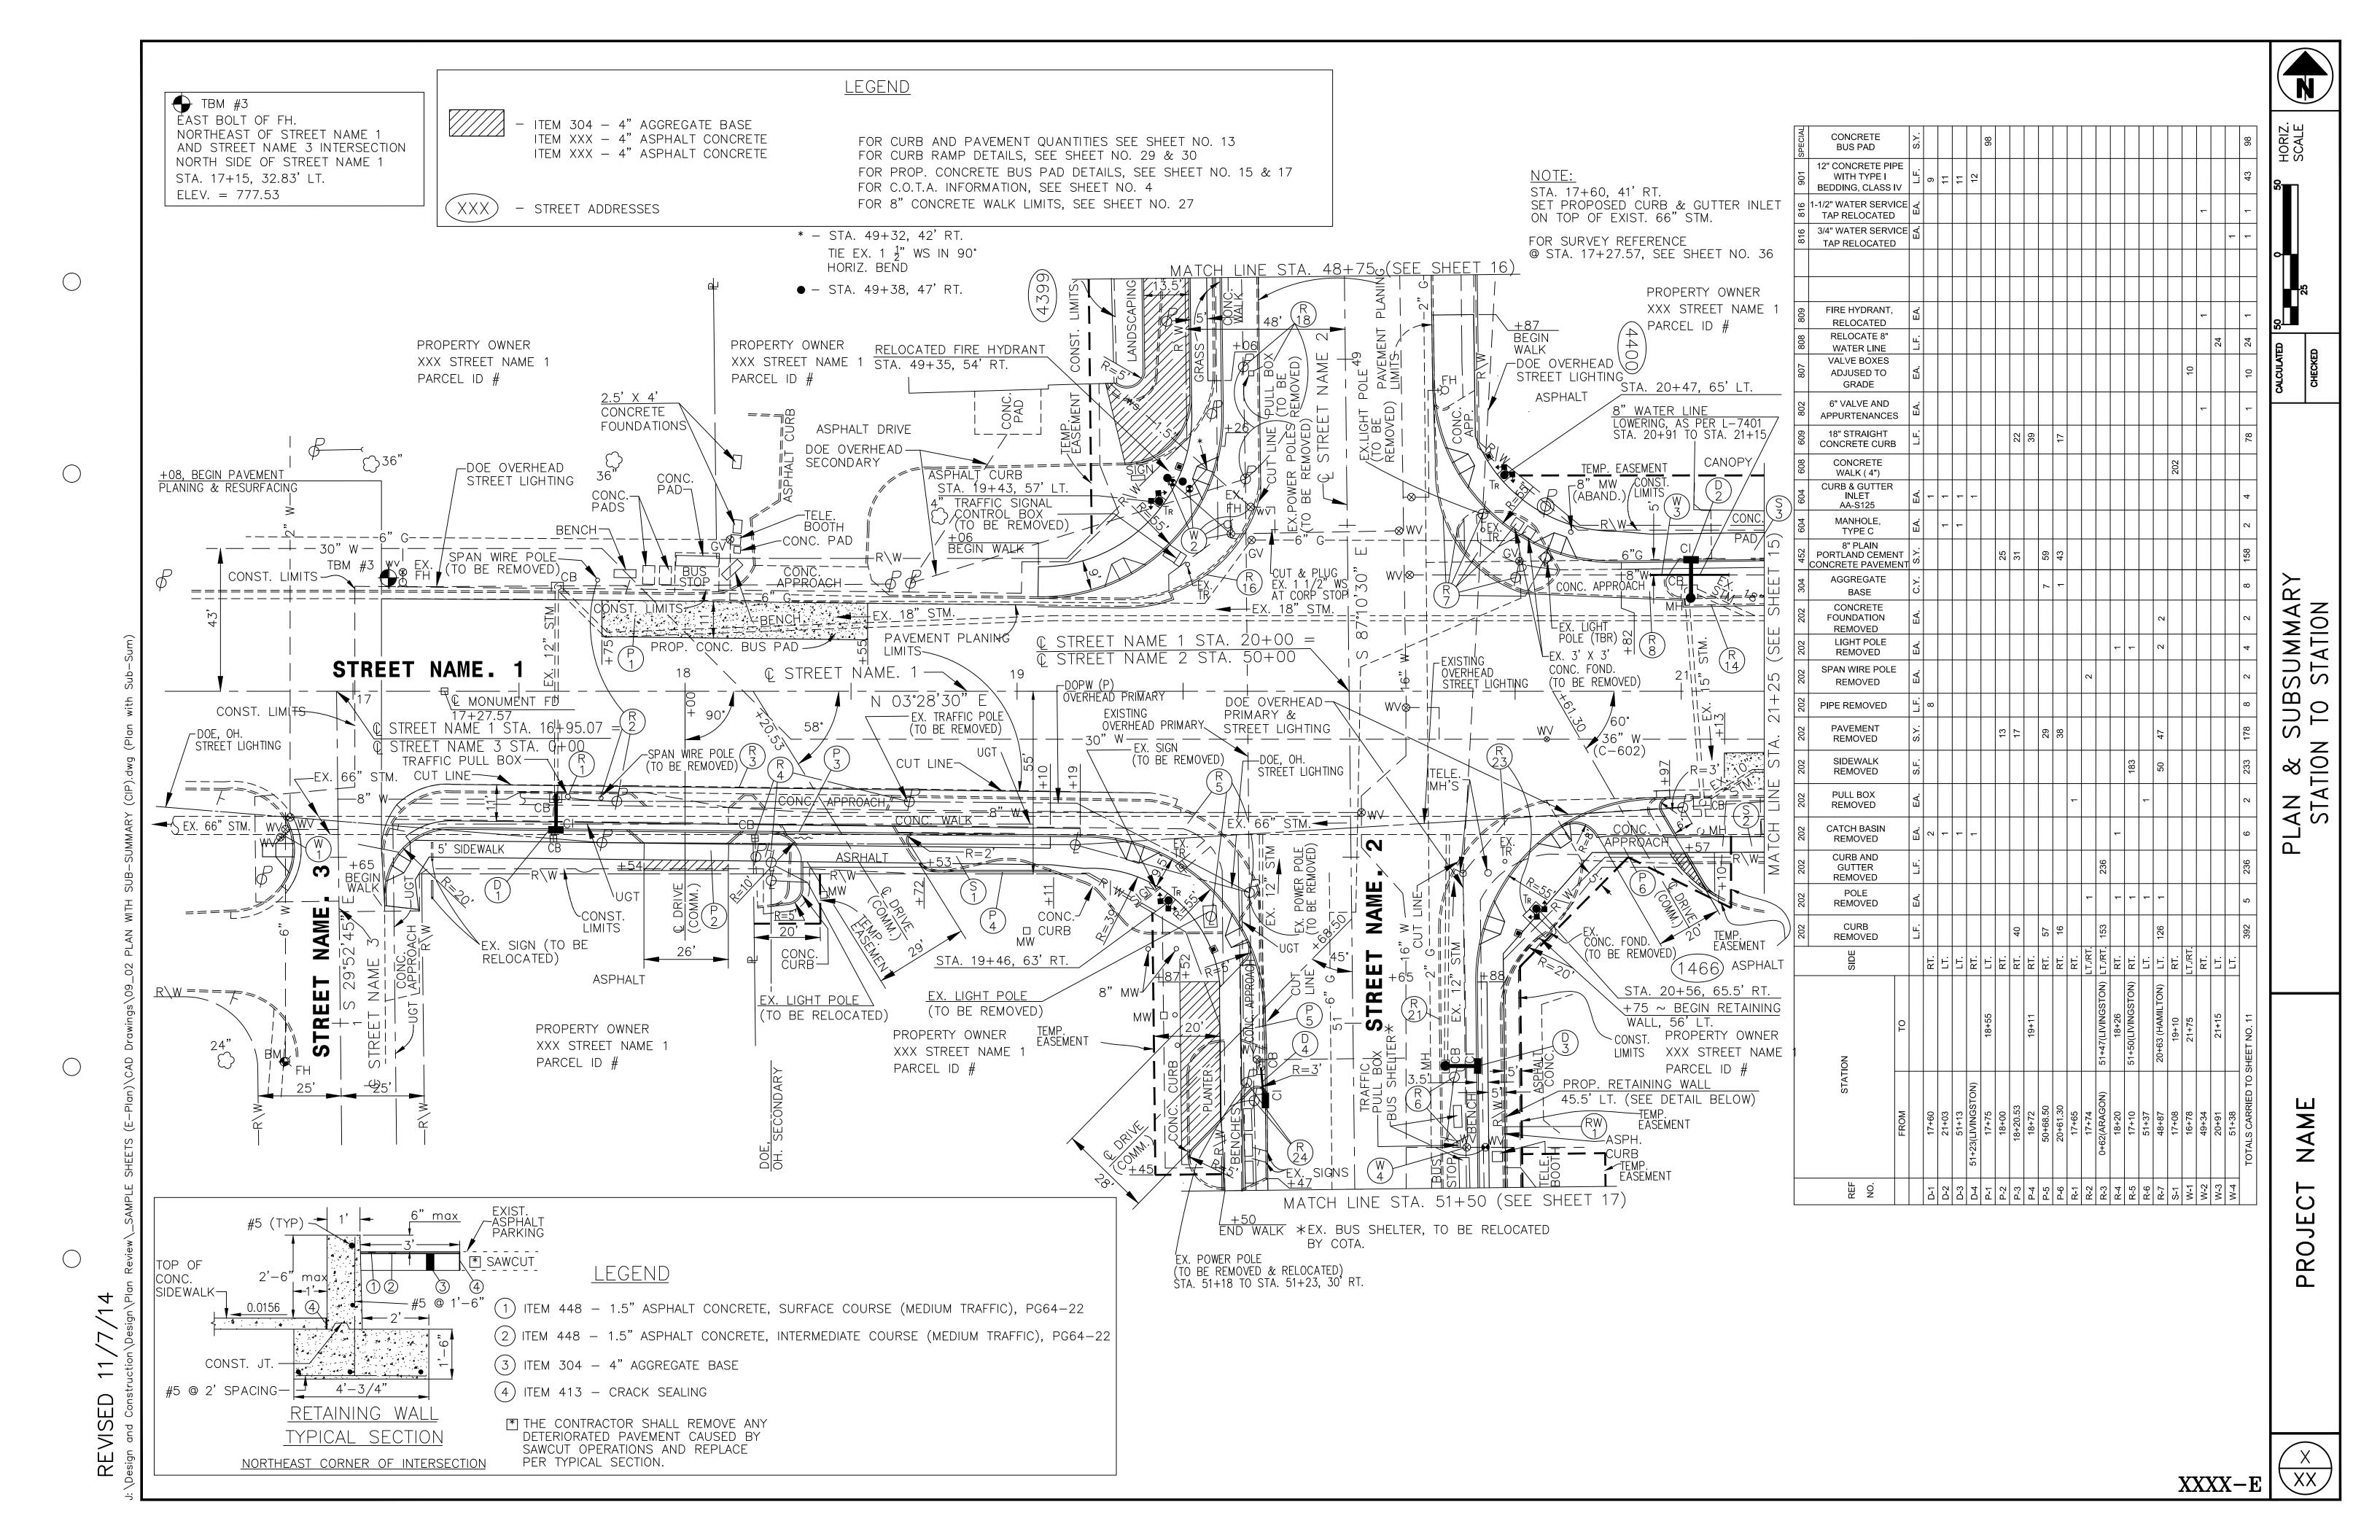

SPECIFIC APPLICATION: This method of inlet protection is applicable where the inlet drains a relatively flat area (slopes no greater than 5 percent) where sheet or overland flows (not exceeding 0.5 cfs) are typical. This method shall not apply to inlets receiving concentrated flows, such as in street and highway

All existing drainage courses shall be maintained during construction and placement of the proposed structure. The contractor shall submit to the City of Columbus a Schedule of Sequence and Method of maintaining the watercourse. Special attention shall be observed to insure that all erosion control features are installed and maintained throughout the duration of the project. Adequate precautions shall be taken to prevent concrete from freezing.

The contractor shall supply 6 sets of reinforcing steel shop drawings to XXX for a plan conformance review. Five sets of the reviewed drawings will be returned to the contractor for distribution.

The foundation, as designed, will produce a bearing pressure of 1.25 ton per square foot (2500 psf). Bottom of footings shall be cast against undisturbed earth.

If unsuitable bearing material occurs at the bottom of the footing elevation, the footing shown shall be deepened or widened to accommodate the changed condition. A registered soil engineer employed by the City of Columbus shall verify the suitability of the bearing material prior to placement of any concrete for the footing. The engineer must approve any

Construction joints shall be provided as shown on the plans. Additional joints requested by the contractor shall be submitted for review and approval by the engineer. All vertical wall joints shall contain waterstop. Waterstop for vertical construction joints shall be approved prior to installation.

Porous backfill shall be placed behind the retaining wall and shall extend from below the walk to 6" below the weephole elevation. Place two cubic feet of bagged aggregate at each

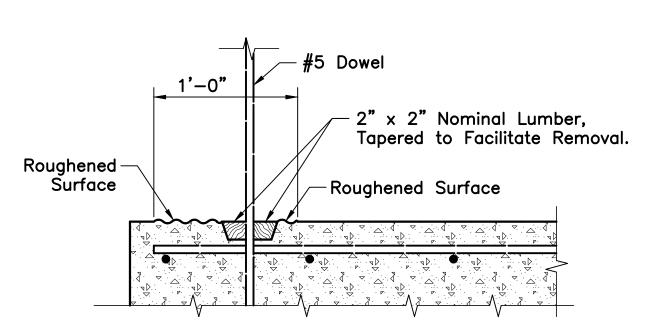

Backfill shall not be placed and the structure shall not impound water until concrete has achieved 4000 psi. Water shall not be impounded against the structure until backfill is in

All exposed non-reentrant corners of concrete shall be cast with a 3/4" x 3/4" chamfer.

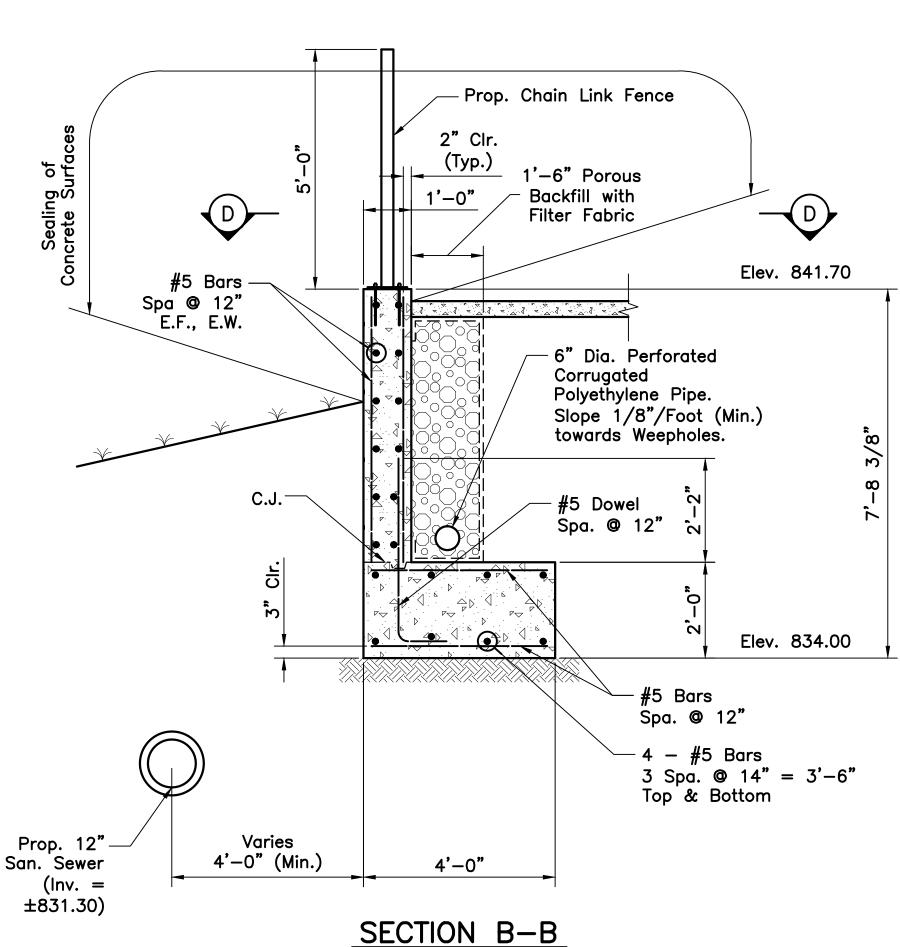

Railing shall be chain link fence. Posts that are to be mounted on wall shall be according to details on this sheet. Railing, posts, plates and anchors shall be galvanized.

All concrete surfaces above grade shall be treated with a clear sealer designed to protect concrete surfaces from graffiti. The material shall be applied in conformance with manufacturer's recommendations. One brand of sealer shall be used for all treated surfaces. Contractor shall provide owner with 5 gallons of unopened sealer for future use by owner. Cost of additional sealer provided to owner shall be included in the price for the wall.
