

## Flowing Kiss

### Three Alternative Solutions:

- **One** : is to leave the five courses of stone and then place either a stone collar or stainless steel one around the column that attaches to the flowing kiss. This would be bead blasted offering a different surface texture than the polished upper piece.
- **Two** : is to remove all stone, and replace with a 3mm Stainless steel sheet column that has been formed to the existing shape. It will be welded at the top and have internal supports. It will come in two halves that will be welded onsite and then bead blasted and blended.
- **Three**: is to leave five courses of stone and then have a shaped stainless steel form fitting the remainder of the space between the underside of the form and the top of the stone. It will be welded at the top and have internal supports. It will come in two halves that will be welded onsite and then bead blasted and blended
