INTRODUCTION
The Franklin County Child Fatality Review Team (CFR), a diverse, expert, community-based group reviews reports of all sleep-related infant deaths in order to learn more about preventing them in the future. When a baby under one year of age dies during sleep, this is called a sleep-related infant death. From 2009 through 2011, there were 79 sleep-related infant deaths in Franklin County, many of which could have been prevented. The information in this data brief is meant to provide an overview of key points on the circumstances surrounding these deaths over the three-year period.

ABOUT THE BABIES
• During 2009-2011, less than one-third (29%) of births in Franklin County were to Black mothers, yet Black babies represent almost half (49%) of all Franklin County sleep-related infant deaths.
• Infants born at term (37 or more completed weeks of gestation) represent almost 80% of all Franklin County sleep-related infant deaths during 2009-2011.

ABOUT THE BABIES’ CAREGIVERS
• During 2009-2011, 14% of births in Franklin County were to mothers who smoked during pregnancy, yet among all sleep-related infant deaths, 43% of infants' mothers smoked during pregnancy.
• Among all sleep-related infant deaths in Franklin County during 2009-2011, over 60% of the infants’ caregivers had at least a high school education.
• Among almost three-fourths (72%) of sleep-related infant deaths in Franklin County during 2009-2011, the infants’ primary caregivers were between the ages of 20 and 34 years.
UNSAFE SLEEP ENVIRONMENTS

Recommendations from multiple public and private organizations, supported by strong and consistent scientific evidence, state that babies are safest sleeping ALONE, on their BACKS, in their own safety-approved CRIB. Other best practices include avoiding smoke exposure during pregnancy and after birth, keeping soft objects and loose bedding out of the crib, and breastfeeding. Columbus Public Health promotes these standards to parents, caregivers, and health care professionals.

From 2009 through 2011, in Franklin County:

- Almost 56% of all sleep-related infant deaths occurred among infants who had shared a sleep surface (with another child, adult, and/or pet).
- Despite the recommendation that all healthy infants be placed on their backs to sleep, the Franklin County CFR team found that only 47% of the cases they reviewed had been placed on their backs.
- Three fourths (75%) of all sleep-related infant deaths occurred among infants found sleeping in a place other than a crib.
